

Class-specific precision and recall under task-specific validation protocols

A Class-specific precision

B Class-specific recall

Forecasting and Nowcasting: fixed 2022 temporal holdout (n = 1,170 each).

Contemporaneous: random five-fold full-OOF row CV (n = 5,575). Protocols and populations differ; metrics are not directly comparable.

n.d. = precision undefined because predicted support is zero; macro calculations use zero_division = 0.
