

Phase-4/5 confusion matrices for the three rescue weighting policies

Cells show count and actual-class row percentage. Black frames mark the task-specific OOF-selected primary policy. Forecasting/Nowcasting use the fixed 2022 temporal holdout (n = 1,170); Contemporaneous uses seed-0 random five-fold row-level full OOF (n = 5,575) with pooled-OOF threshold selection. Protocols and populations differ and are not directly comparable.
