

Five-class errors for the selected primary Phase-4/5 rescue policies

Each panel shows the task-specific OOF-selected primary rescue policy.
Cells show count and percentage within each actual phase; rows are actual phases and columns are predicted phases.
Forecasting and Nowcasting: fixed 2022 temporal holdout (n = 1,170 each).
Contemporaneous: seed-0 random row-level five-fold full OOF (n = 5,575).
Its threshold uses pooled OOF selection (not nested/independent).
Protocols and populations differ; results are not directly comparable.
